- 1 (a) Express $-2x^2 - 12x - 14$ in the form $a(x-h)^2 + k$. [2]

		Solutions
1	(a)	$\begin{aligned} & -2x^2 - 12x - 14 \\ &= -2[x^2 + 6x] - 14 \\ &= -2[(x+3)^2 - 3^2] - 14 \\ &= -2(x+3)^2 + 18 - 14 \\ &= -2(x+3)^2 + 4 \end{aligned}$

- (b) Using your answer to part (a), explain why the maximum value of $-2x^2 - 12x - 14$ is k . [2]

		Solutions
1	(b)	Since $(x-3)^2 \geq 0$ $-2(x-3)^2 \leq 0$ $-2(x-3)^2 + 4 \leq 4$ Therefore, the maximum value of $-2x^2 - 12x - 14$ is 4. [Alternative Solution] Note that the coefficient of x^2 is negative (or $a < 0$). Since the maximum point of $y = -2x^2 - 12x - 14$ is $(-3, 4)$, its maximum value is the y-coordinate.

- 2 Solve the equation $x = 3\sqrt{3} + \frac{12}{x}$, where $x \neq 0$, giving your answer in its simplest surd form. [4]

Solutions	
2	$x^2 - 3\sqrt{3}x - 12 = 0$ (accept $x^2 - \sqrt{27}x - 12 = 0$) $x = \frac{3\sqrt{3} \pm \sqrt{27 - 4(-12)}}{2}$ $x = \frac{3\sqrt{3} \pm \sqrt{75}}{2}$ Since $\sqrt{75} = 5\sqrt{3}$, $x = \frac{3\sqrt{3} \pm 5\sqrt{3}}{2}$ $x = 4\sqrt{3} \text{ or } x = -\sqrt{3}$

- 3 The spread of bird flu in a certain duck farm is given by $B(t) = \frac{300}{1 + e^{5-t}}$, where t is the number of days since the flu first appeared, and $B(t)$ is the total number of ducks which have caught the flu to date.

- (a) Estimate the initial number of ducks infected with the flu.
Give your answer correct to the nearest integer.

[1]

		Solutions
3	(a)	When $t = 0$, $B(0) = \frac{300}{1 + e^{5-0}}$ 2.01 (3 s.f.) Initial number of infected ducks is 2.

- (b) If the day that the flu first appeared is Day 0, find out on which day would the number of infected ducks first reach 100.

[2]

		Solutions
3	(b)	$\frac{300}{1 + e^{5-t}} = 100$ $300 = 100 + 100e^{5-t}$ $100e^{5-t} = 200$ $e^{5-t} = 2$ $5-t = \ln 2$ $t = 4.31 \text{ (to 3 s.f.)}$ The number of infected ducks first reached 100 on Day 4.

- (c) Explain clearly why the number of infected ducks will never exceed 300.

[2]

		Solutions
3	(c)	For all values of t, $e^{5-t} > 0$. $1 + e^{5-t} > 1$ $1 > \frac{1}{1 + e^{5-t}}$ $\frac{1}{1 + e^{5-t}} < 1$ $B(t) = \frac{300}{1 + e^{5-t}} < 300$ Therefore the number of infected ducks will never exceed 300.

4 A calculator must not be used in this question.

(a) Show that $\tan 15^\circ = 2 - \sqrt{3}$.

[3]

		Solutions
4	(a)	$\begin{aligned} \tan 15^\circ &= \tan(45^\circ - 30^\circ) \\ &= \frac{\tan 45^\circ - \tan 30^\circ}{1 + \tan 45^\circ \tan 30^\circ} \\ &= \frac{1 - \frac{\sqrt{3}}{3}}{1 + \frac{\sqrt{3}}{3}} \\ &= \frac{3 - \sqrt{3}}{3 + \sqrt{3}} \times \frac{3 - \sqrt{3}}{3 - \sqrt{3}} \\ &= \frac{9 - 6\sqrt{3} + 3}{6} \\ &= 2 - \sqrt{3} \end{aligned}$
		Alternative solution $\begin{aligned} \tan 15^\circ &= \tan(60^\circ - 45^\circ) \\ &= \frac{\tan 60^\circ - \tan 45^\circ}{1 + \tan 60^\circ \tan 45^\circ} \\ &= \frac{\sqrt{3} - 1}{1 + (\sqrt{3})(1)} \\ &= \frac{\sqrt{3} - 1}{1 + \sqrt{3}} \times \frac{1 - \sqrt{3}}{1 - \sqrt{3}} \\ &= \frac{\sqrt{3} - 3 - 1 + \sqrt{3}}{1 - 3} \\ &= 2 - \sqrt{3} \text{ (shown)} \end{aligned}$

- (b) Using your answer in part (a), find an expression for $\sec^2 15^\circ$ in the form $a + b\sqrt{3}$ where a and b are integers.

[2]

		Solutions
4	(b)	$\tan 15^\circ = 2 - \sqrt{3}$ $\sec^2 15^\circ = 1 + \tan^2 15^\circ$ $\sec^2 15^\circ$ $= 1 + (2 - \sqrt{3})^2$ $= 1 + (4 - 4\sqrt{3} + 3)$ $= 8 - 4\sqrt{3}$

- 5 (a) Express $\frac{48x^3 + 86x^2 - 2x - 32}{6x^2 + 13x + 6}$ as the sum of a polynomial and a proper fraction. [2]

		Solutions
5	(a)	$ \begin{array}{r} 8x - 3 \\ 6x^2 + 13x + 6 \overline{) 48x^3 + 86x^2 - 2x - 32} \\ \underline{-(48x^3 + 104x^2 + 48x)} \\ -18x^2 - 50x - 32 \\ \underline{-(-18x^2 - 39x - 18)} \\ -11x - 14 \end{array} $ $ \therefore \frac{48x^3 + 86x^2 - 2x - 32}{6x^2 + 13x + 6} = 8x - 3 + \frac{-11x - 14}{6x^2 + 13x + 6} $ $ = 8x - 3 - \frac{11x + 14}{(3x + 2)(2x + 3)} $

(b)	Hence, express $\frac{48x^3 + 86x^2 - 2x - 32}{6x^2 + 13x + 6}$ as the sum of a polynomial and partial fractions. [4]

- (b) Explain why the equation $5x^2 - kx + 2k^2 + 8 = 0$ has no real roots for all real values of k . [2]

		Solutions
6	(b)	$5x^2 - kx + 2k^2 + 8 = 0$ Discriminant $= (-k)^2 - 4(5)(2k^2 + 8)$ $= k^2 - 40k^2 - 160$ $= -39k^2 - 160$ Since $k^2 \geq 0$ for all real values of k, then $-39k^2 \leq 0$, i.e. $-39k^2 - 160 \leq -160$. - 6 Samuel designs an open rectangular tank with the capacity of 216 m^3 . The tank has a square base with length of x metres and a height of h metres. Material cost for the four walls of the tank costs $\$36/\text{m}^2$ and the material cost of the base is $\$90/\text{m}^2$.

- (i) If C is the total material cost for making the tank in dollars, show that

$$C = 90x^2 + \frac{31104}{x}.$$

[3]

Solutions		
6	(i)	$x^2h = 216$ $h = \frac{216}{x^2}$ $C = 36(4xh) + 90x^2$ $C = 36(4x) \left(\frac{216}{x^2} \right) + 90x^2$ $C = 90x^2 + \frac{31104}{x}$

(ii) Given that x can vary, find the value of x for which C' is stationary.

[3]

Solutions		
6	(ii)	$\frac{dC'}{dx} = 180x + (-1) \left(\frac{31104}{x^2} \right)$ $180x - (-1) \left(\frac{31104}{x^2} \right) = 0$ $180x^3 - 31104 = 0$ $x = \sqrt[3]{\frac{864}{5}}$ $= 5.5699066$ $= 5.57 \text{ m (3 significant figures)}$

(iii) Determine whether this value of x gives a maximum or minimum value for C' . Hence state the value of C' .

[3]

Solutions		
6	(iii)	When $x = 5.5699066$, $\frac{d^2C'}{dx^2} = 180 + (2) \left(\frac{31104}{5.5699066^3} \right) > 0$ Since $\frac{d^2C'}{dx^2} > 0$, C' is a minimum value. Minimum cost: $90(5.56991)^2 - \frac{31104}{(5.56991)}$ $= \$8376.44$

The diagram shows a metal bar OA , which is hinged at O , and another metal bar AB , which is hinged at A . The bars can move in the xy -plane with origin O where x and y axes are horizontal and vertical respectively. The bar OA can turn about O and is inclined at an angle θ to the y -axis, where $0^\circ < \theta \leq \omega$ and ω is an acute angle. The bar AB can turn about A in such a way that the inclination to the horizontal is also θ , and that B is above the x -axis. The lengths of OA and AB are 7 m and 4 m respectively.

It is given that the perpendicular distance of B from the x -axis is h m.

(a) Express h in the form $a \cos \theta - b \sin \theta$, where a and b are integers.

[2]

		Solutions
7	(a)	Let h_1 and h_2 be the vertical component of OA and AB respectively. $h_1 = 7 \cos \theta$ $h_2 = 4 \sin \theta$ Therefore $h = 7 \cos \theta - 4 \sin \theta$

- (b) Show that ω is approximately 60.255° corrected to 3 decimal places. [2]

		Solutions
7	(b)	For B to be above the x-axis, $h \geq 0$ $7 \cos \theta - 4 \sin \theta \geq 0$ $\tan \theta \leq \frac{7}{4}$ $\omega = \tan^{-1} \frac{7}{4}$ $= 60.25511^\circ$ $= 60.255^\circ \text{ (shown)}$

- (c) Using your answer in (a), express h in the form $R \cos(\theta - \alpha)$, where $R > 0$ and $0^\circ < \alpha < 90^\circ$. [3]

		Solutions
7	(c)	$h = 7 \cos \theta - 4 \sin \theta$ $R = \sqrt{7^2 + 4^2} = \sqrt{65}$ $\alpha = \tan^{-1} \frac{4}{7} = 29.745^\circ$ $h = \sqrt{65} \cos(\theta + 29.7^\circ)$

- (d) Without doing any further calculation, explain why there is a solution for θ at $h = 6$.

[1]

		Solutions
7	(d)	$h = 6$ is equivalent to $h = \sqrt{65} \cos(\theta + 29.745^\circ)$ Since the maximum of h is $\sqrt{65}$, which is greater than 6, there is a θ which satisfy the equation.

- (e) Find the value of θ such that $h = 6$.

[2]

		Solutions
7	(e)	$\sqrt{65} \cos(\theta + 29.745^\circ) = 6$ $\cos(\theta + 29.745^\circ) = \frac{6}{\sqrt{65}}$ Basic angle = 41.909° $\theta + 29.745^\circ = 41.909^\circ$ $\theta = 12.2^\circ$ $\theta = 12.2^\circ$

8 A circle has equation $x^2 + y^2 - 4x - 8y - 5 = 0$.

(a) Find the radius and the coordinates of the centre of the circle C.

[3]

		Solutions
8	(a)	Let $2g = -4, g = -2$ Let $2f = 8, f = 4$ Centre = $(2, -4)$ Radius = $\sqrt{(-2)^2 + (4)^2} - 5$ = 5 units

The line $3y = -x - 5$ cuts the circle at two points A and B .

(b) Find the shortest distance of the centre C from the line AB , expressing your

answer in the form $\frac{1}{2}\sqrt{n}$, where n is an integer.

[7]

		Solutions
8	(b)	$3y = -x - 5$ $x = -3y - 5 \dots (1)$ $x^2 + y^2 - 4x + 8y - 5 = 0$ $(-3y - 5)^2 + y^2 - 4(-3y - 5) + 8y - 5 = 0$ $9y^2 + 30y + 25 + y^2 + 12y + 20 + 8y - 5 = 0$ $10y^2 + 50y + 40 = 0$ $y^2 + 5y + 4 = 0$ $(y + 1)(y + 4) = 0$ $y = -1$ or $y = -4$ When $y = -1$, $x = -2 \rightarrow (-2, -1)$ When $y = -4$, $x = 7 \rightarrow (7, -4)$ The shortest distance from centre C to AB can be found by calculating the distance from C to the midpoint of AB. $M\left(\frac{-2+7}{2}, \frac{-1+(-4)}{2}\right)$ $M(2.5, -2.5)$ $C(2, -4)$ $CM = \sqrt{(2.5 - 2)^2 + (-2.5 - (-4))^2}$ $= \frac{1}{2}\sqrt{10}$

[1]

- (ii) Given that $m = 3^x$, express $3^{2x-2} + k = 6(3^{x-2})$ as a quadratic equation in m .

[2]

		Solutions
9	(a) (ii)	$3^{2x-2} + k = 6(3^{x-2})$ $\frac{(3^x)^2}{3^2} + k = 6\left(\frac{3^x}{3^2}\right)$ Since $m = 3^x$, $\frac{m^2}{9} + k = \frac{6m}{9}$ $m^2 - 6m + 9k = 0$

- (iii) If $k > 1$, explain why there are no real solutions for $3^{2x-2} + k = 6(3^{x-2})$.

[3]

		Solutions
9	(a) (iii)	Discriminant $= (-6)^2 - 4(1)(-9k)$ $= 36 - 36k$ If $k > 1$, $-36k < -36$ $36 - 36k < 36 - 36$ Discriminant < 0 Therefore $3^{2x-2} + k = 6(3^{x-2})$ has no real solutions.
