## 6092/01

Paper 1 Multiple Choice

**03 September 2025**  
**0800 – 0900**  
**1 hour**

Additional Material: Optical Mark Recognition (OMR)

**READ THESE INSTRUCTIONS FIRST**

Write in soft pencil.  
 Do not use staples, paper clips, glue or correction fluid.  
 Write your name, class, index number on the OMR and this question booklet.

There are **forty** questions on this paper. Answer **all** questions. For each question, there are four possible answers **A, B, C** and **D**.

Choose the **one** you consider correct and record your choice in **soft pencil** on the separate OMR.

Each correct answer will score one mark. A mark will not be deducted for a wrong answer.  
 Any rough working should be done on this paper.  
 A copy of the Periodic Table is printed on page **13**.  
 The use of an approved scientific calculator is expected, where appropriate.

| PARENT'S SIGNATURE | FOR EXAMINER'S USE |    |
|--------------------|--------------------|----|
|                    |                    | 40 |

- 1 The melting points and boiling points of four substances are shown. Which substance exist as a monatomic gas at  $-200^{\circ}\text{C}$ ?

|          | substance | melting point / $^{\circ}\text{C}$ | boiling point / $^{\circ}\text{C}$ |
|----------|-----------|------------------------------------|------------------------------------|
| <b>A</b> | argon     | $-189$                             | $-186$                             |
| <b>B</b> | hydrogen  | $-259$                             | $-253$                             |
| <b>C</b> | neon      | $-249$                             | $-246$                             |
| <b>D</b> | nitrogen  | $-210$                             | $-196$                             |

- 2 The diagram shows a set-up used to separate hexane (boiling point,  $70^{\circ}\text{C}$ ) and heptane (boiling point,  $98^{\circ}\text{C}$ ).

Which graph would be obtained if the temperature at point **T** was plotted against the total volume of distillate collected?

- 3** A student wants to show that the rate of the reaction between a fixed mass of calcium carbonate and dilute hydrochloric acid doubles for every 10 °C rise in temperature. The student wants to measure the volume of carbon dioxide released to find the rate of reaction. The student has a measuring cylinder and a gas syringe. What other essential apparatus are required?

- A** Bunsen burner, burette, electronic balance, stopwatch  
**B** Bunsen burner, electronic balance, stopwatch, thermometer  
**C** Bunsen burner, pipette, stopwatch, thermometer  
**D** burette, pipette, electronic balance, thermometer

- 4** Some properties of substances X, Y and Z are given in the table below.

| substance | percentage composition by mass | solid conducts electricity | changes on heating                                                     |
|-----------|--------------------------------|----------------------------|------------------------------------------------------------------------|
| X         | constant                       | yes                        | solid burns in air to form an oxide<br>solid decomposes<br>solid melts |
| Y         | constant                       | no                         |                                                                        |
| Z         | varies                         | yes                        |                                                                        |

Which classification of the substances is correct?

|          | element | mixture | compound |
|----------|---------|---------|----------|
| <b>A</b> | X       | Z       | Y        |
| <b>B</b> | Y       | Z       | X        |
| <b>C</b> | Z       | Y       | X        |
| <b>D</b> | X       | Y       | Z        |

- 5** The diagram below shows the chromatogram of four substances, W, X, Y and Z.

Which statement is correct?

- A** W contains X and Y.  
**B** X is more soluble than Z.  
**C** Y contains three components.  
**D** Z has a larger  $R_f$  value than X.

- 6 The atomic number of cerium, Ce, is 58. A  $\text{Ce}^{4+}$  ion has 140 nucleons. How many neutrons and electrons are there in one  $\text{Ce}^{4+}$  ion?

|          | neutrons | electrons |
|----------|----------|-----------|
| <b>A</b> | 82       | 54        |
| <b>B</b> | 82       | 62        |
| <b>C</b> | 140      | 54        |
| <b>D</b> | 140      | 62        |

- 7 Diamond, graphite, iodine and silicon dioxide all contain covalent bonds. Which statement is correct?

- A** Diamond has atoms that are arranged in a tetrahedral structure.
- B** Graphite is used as a lubricant because each layer in its structure is held to the next layer by strong covalent bonds.
- C** Iodine changes from solid to gas upon gentle warming as its covalent bonds are weak.
- D** Both graphite and silicon dioxide can conduct electricity due to the presence of mobile electrons.

- 8 The electronic configurations of three particles, X, Y and Z are shown.

| particles | electronic configuration |
|-----------|--------------------------|
| X         | 2,1                      |
| Y         | 1                        |
| Z         | 2,8,7                    |

Which statement is true about these three particles?

- A** X forms covalent bonds with Z.
  - B** X forms ionic bonds with Y.
  - C** Y can only form ionic bonds.
  - D** Y forms ionic bonds with Z.
- 9 Peeling onions often causes tearing of the eyes due to the release of a sulfide compound. Peeling them under running water reduces the problem. Which of the following statements are true about the sulfide compound?

- 1 It is volatile.
- 2 It is soluble in water.
- 3 It is an ionic compound with strong ionic bonds.
- 4 It is a covalent compound with weak covalent bonds.

- A** 1 and 2                      **B** 1 and 3                      **C** 1 and 4                      **D** 2 and 4

10 Which molecule has the greatest number of bonded electrons?

- A** C<sub>2</sub>H<sub>4</sub>                      **B** CO<sub>2</sub>                      **C** CH<sub>3</sub>OH                      **D** HCO<sub>2</sub>H

11 Hydrazine, N<sub>2</sub>H<sub>4</sub>, is a powerful reducing agent. When reacted with an aqueous solution containing silver ions, nitrogen is one of the products formed. Which ionic equation best represents this reaction?

- A** N<sub>2</sub>H<sub>4</sub> + 2Ag<sup>+</sup> → N<sub>2</sub> + 2AgH<sub>2</sub>  
**B** N<sub>2</sub>H<sub>4</sub> + Ag<sup>+</sup> → N<sub>2</sub> + 2H<sub>2</sub> + Ag  
**C** N<sub>2</sub>H<sub>4</sub> + Ag<sup>+</sup> → N<sub>2</sub> + H<sup>+</sup> + Ag  
**D** N<sub>2</sub>H<sub>4</sub> + 4Ag<sup>+</sup> → N<sub>2</sub> + 4H<sup>+</sup> + 4Ag

12 An element burns in air to form a compound which dissolves in dilute hydrochloric acid and aqueous sodium hydroxide.  
What is the element?

- A** carbon                      **B** iron                      **C** aluminium                      **D** sulfur

13 The results of some experiments with sulfur dioxide are shown.

| experiment | description                                    | result                           |
|------------|------------------------------------------------|----------------------------------|
| 1          | mix with dilute hydrochloric acid              | does not react                   |
| 2          | mix with concentrated sodium hydroxide         | a salt is formed                 |
| 3          | add Universal Indicator                        | Universal Indicator turns violet |
| 4          | add acidified aqueous potassium manganate(VII) | purple solution turns colourless |

Which experiments show correct results?

- A** 1 and 2 only                      **B** 3 and 4 only                      **C** 1, 2 and 4                      **D** 2, 3 and 4

14 Calcium chloride is made by adding powdered calcium carbonate to dilute hydrochloric acid. Which row identifies the reagent that should be added in excess and the purification method that is used to make a pure and dry sample of calcium chloride?

|          | excess reagent           | purification method            |
|----------|--------------------------|--------------------------------|
| <b>A</b> | calcium carbonate        | filtration only                |
| <b>B</b> | calcium carbonate        | filtration and crystallisation |
| <b>C</b> | dilute hydrochloric acid | filtration only                |
| <b>D</b> | dilute hydrochloric acid | filtration and crystallisation |

- 15 The graph below shows the mass of precipitate Y formed when aqueous lead(II) nitrate and solution X are added successively to unknown solution M.

What are the possible identities of precipitate Y and solution X?

|          | precipitate Y              | solution X     |
|----------|----------------------------|----------------|
| <b>A</b> | $\text{PbCl}_2$            | $\text{NaOH}$  |
| <b>B</b> | $\text{PbCO}_3$            | $\text{HNO}_3$ |
| <b>C</b> | $\text{Pb}(\text{NO}_3)_2$ | $\text{HNO}_3$ |
| <b>D</b> | $\text{PbSO}_4$            | $\text{NaOH}$  |

- 16 Zinc oxide is produced by heating zinc carbonate.  
What is the percentage yield of zinc oxide if 125 g of zinc carbonate produces 75 g of zinc oxide on heating?

**A**  $\frac{75}{81} \times 100$      
 **B**  $\frac{125 \times 81}{75} \times 100$      
 **C**  $\frac{75}{125} \times 100$      
 **D**  $\frac{75}{81 \times 125} \times 100$

- 17 A fuel gas cylinder contains 6 g of ethane gas,  $\text{C}_2\text{H}_6$ , under room temperature and pressure.  
Which statement is **incorrect**?

- A** It contains 1.2 mol of hydrogen atoms.  
**B** It contains 0.2 mol of ethane molecules.  
**C** It contains  $1.20 \times 10^{23}$  ethane molecules.  
**D** It occupies a volume of  $0.25 \text{ dm}^3$ .

- 18  $60 \text{ cm}^3$  of hydrogen are reacted with  $30 \text{ cm}^3$  of oxygen to form water vapour.  
What are the volumes of the gases remaining, at room temperature and pressure?

|          | hydrogen / $\text{cm}^3$ | oxygen / $\text{cm}^3$ | water vapour / $\text{cm}^3$ |
|----------|--------------------------|------------------------|------------------------------|
| <b>A</b> | 30                       | 0                      | 0                            |
| <b>B</b> | 30                       | 15                     | 30                           |
| <b>C</b> | 0                        | 0                      | 60                           |
| <b>D</b> | 0                        | 0                      | 0                            |

19 Four experiments of rusting are shown.

Which two experiments can be used to show that oxygen is needed for iron to rust?

- A** 1 and 3                      **B** 1 and 4                      **C** 2 and 3                      **D** 2 and 4

20 A small piece of sodium is added to aqueous iron(II) sulfate. Which of the following is **not** observed during this reaction?

- A** A grey solid is formed.  
**B** A white precipitate is formed.  
**C** Bubbles of gas are formed.  
**D** The pale green solution turns colourless.

21 Some reactions are stated below.

- 1  $\text{H}_2\text{SO}_4 + 2\text{NH}_3 \rightarrow (\text{NH}_4)_2\text{SO}_4$
- 2  $\text{H}_2\text{SO}_4 + \text{Zn} \rightarrow \text{ZnSO}_4 + \text{H}_2$
- 3  $\text{K}_2\text{Cr}_2\text{O}_7 + 2\text{KOH} \rightarrow 2\text{K}_2\text{CrO}_4 + \text{H}_2\text{O}$

How many of the reactions are redox reactions?

- A** 0                      **B** 1                      **C** 2                      **D** 3

22 Which noble gas has the highest concentration in dry air?

- A** argon  
**B** krypton  
**C** helium  
**D** neon

23 Which pair of gases will cause the most damage to limestone buildings?

- A** carbon monoxide and nitrogen monoxide  
**B** chlorofluorocarbons and ozone  
**C** methane and sulfur dioxide  
**D** nitrogen dioxide and sulfur dioxide

- 24** Which property shows a general decrease when going down any group in the Periodic Table?
- A** the reactivity of the elements
  - B** the oxidising ability of the elements
  - C** the number of electrons in the valence shell
  - D** the tendency of the elements to form positive ions
- 25** Which pair of elements, when reacted together, would give the most violent reaction?
- A** caesium and fluorine
  - B** lithium and iodine
  - C** potassium and bromine
  - D** sodium and chlorine
- 26** Magnesium reacts with acid. Which solution would give the fastest initial rate of reaction?
- A** 40 g of hydrochloric acid in 500 cm<sup>3</sup> of water
  - B** 20 g of hydrochloric acid in 1000 cm<sup>3</sup> of water
  - C** 40 g of sulfuric acid in 500 cm<sup>3</sup> of water
  - D** 20 g of sulfuric acid in 1000 cm<sup>3</sup> of water
- 27** In the electrolysis of molten sodium chloride, 46 g of sodium is formed at the cathode. How many moles of chlorine gas are formed at the anode?
- A** 0.0 mol                      **B** 0.5 mol                      **C** 1.0 mol                      **D** 2.0 mol
- 28** The effects of a change in conditions on a chemical reaction are listed.
- 1 The total number of collisions per minute increased.
  - 2 The average energy of the particles increased.
  - 3 The activation energy increased.

Which of the above effects are result of an increase in temperature?

- A** 1 only
- B** 2 only
- C** 1 and 2
- D** 1, 2 and 3

- 29 The enthalpy change for the reaction shown in this equation is  $-1560 \text{ kJ}$ .

What is the heat change when 1 mole of ethane is burned?

- A 780 kJ of heat is absorbed  
 B 780 kJ of heat is released  
 C 1560 kJ of heat is absorbed  
 D 1560 kJ of heat is released
- 30 Dilute hydrochloric acid was added to some marble chips in a conical flask and the total mass of the flask and its contents is weighed at regular intervals. Both reactants are used up at the end of the reaction. The graph labelled experiment 1 was obtained.

If the experiment is repeated, what changes will be necessary to obtain the graph for experiment 2?

|   | marble chips    | dilute hydrochloric acid          |
|---|-----------------|-----------------------------------|
| A | grind to powder | no change                         |
| B | no change       | same volume, higher concentration |
| C | use more        | same volume, same concentration   |
| D | use more        | larger volume, same concentration |

- 31 In Haber process, nitrogen and hydrogen react as shown.

How do the speed and the final yield of the reaction change, if the pressure in the vessel is increased but the temperature is kept constant?

|   | speed of forward reaction | final yield of reaction |
|---|---------------------------|-------------------------|
| A | increase                  | no change               |
| B | increase                  | increase                |
| C | no change                 | no change               |
| D | no change                 | increase                |

- 32 The apparatus shown is set up to plate a steel key with copper.

Which of the following explains the observation that will be made on the electrolyte?

- A Water is electrolysed leading to volume of water decreasing.
- B Concentration of  $\text{Cu}^{2+}$  decreases leading to the fading of  $\text{CuSO}_4$  colour.
- C Concentration of  $\text{Cu}^{2+}$  increases leading to the darkening of  $\text{CuSO}_4$  colour.
- D Concentration of  $\text{Cu}^{2+}$  remains unchanged leading to no change in colour intensity of  $\text{CuSO}_4$ .

- 33 The energy profile diagram for the Haber process is shown below.

Which statement is correct?

- A The reverse reaction is exothermic.
  - B The enthalpy change of the forward reaction is equal to  $(W - Z)$ .
  - C The activation energies of the forward and reverse reactions are equal to Y.
  - D The activation energy of the reverse reaction is greater than that of the forward reaction.
- 34 Which of the following is true of a homologous series?

- A Each member differs from the previous one by one carbon and four hydrogen atoms.
- B The viscosity increases as the carbon chain of the members increases.
- C The members have the same empirical formula.
- D The members have the same structural formula.

**35** Which statement about vegetable oil and the margarine made from it is correct?

- A** Both are liquids at room temperature.
- B** Both occur naturally.
- C** Margarine has higher melting point than vegetable oil.
- D** Vegetable oil has fewer carbon-carbon double bonds than margarine.

**36** Hydrolysis using an alkali will result in the ester linkage being broken and the carboxyl functional group reacting with the base to form a salt.

The diester below can be hydrolysed by heating with aqueous sodium hydroxide.

What would be the products of the reaction?

- A**  $\begin{array}{c} \text{O} \\ || \\ \text{H}-\text{C} \\ | \\ \text{OH} \end{array}$      $\begin{array}{c} \text{H} & \text{H} & \text{H} \\ | & | & | \\ \text{HO}-\text{C} & -\text{C} & -\text{C}-\text{OH} \\ | & | & | \\ \text{H} & \text{H} & \text{H} \end{array}$      $\begin{array}{c} \text{O} & \text{H} \\ || & | \\ \text{HO}-\text{C} & -\text{C}-\text{H} \\ & | \\ & \text{H} \end{array}$
- B**  $\begin{array}{c} \text{O} \\ || \\ \text{H}-\text{C} \\ | \\ \text{OH} \end{array}$      $\begin{array}{c} \text{H} & \text{H} & \text{H} \\ | & | & | \\ \text{NaO}-\text{C} & -\text{C} & -\text{C}-\text{ONa} \\ | & | & | \\ \text{H} & \text{H} & \text{H} \end{array}$      $\begin{array}{c} \text{O} & \text{H} \\ || & | \\ \text{HO}-\text{C} & -\text{C}-\text{H} \\ & | \\ & \text{H} \end{array}$
- C**  $\begin{array}{c} \text{O} \\ || \\ \text{H}-\text{C} \\ | \\ \text{ONa} \end{array}$      $\begin{array}{c} \text{H} & \text{H} & \text{H} \\ | & | & | \\ \text{HO}-\text{C} & -\text{C} & -\text{C}-\text{OH} \\ | & | & | \\ \text{H} & \text{H} & \text{H} \end{array}$      $\begin{array}{c} \text{O} & \text{H} \\ || & | \\ \text{NaO}-\text{C} & -\text{C}-\text{H} \\ & | \\ & \text{H} \end{array}$
- D**  $\begin{array}{c} \text{O} \\ || \\ \text{H}-\text{C} \\ | \\ \text{ONa} \end{array}$      $\begin{array}{c} \text{H} & \text{H} & \text{H} \\ | & | & | \\ \text{NaO}-\text{C} & -\text{C} & -\text{C}-\text{ONa} \\ | & | & | \\ \text{H} & \text{H} & \text{H} \end{array}$      $\begin{array}{c} \text{O} & \text{H} \\ || & | \\ \text{NaO}-\text{C} & -\text{C}-\text{H} \\ & | \\ & \text{H} \end{array}$

**37** How many of the following reactions involve the formation of water?

- 1 ethanol and ethanoic acid
- 2 glucose and yeast
- 3 ethene and oxygen
- 4 ethane and chlorine

**A** 1                                      **B** 2                                      **C** 3                                      **D** 4

**38** You are provided with the following list of chemicals.

- 1 aqueous bromine
- 2 aqueous sodium carbonate
- 3 litmus solution
- 4 propanol

How many of these chemicals can be used to distinguish between propene and propanoic acid at room temperature?

**A** 0                                      **B** 2                                      **C** 3                                      **D** 4

**39** The structure of serine is shown below.

Which statement about serine is **false**?

- A** It produces carbon dioxide when reacted with sodium carbonate.
- B** It burns in air to produce carbon dioxide, water and oxides of nitrogen.
- C** It can undergo condensation polymerisation with other molecules of serine.
- D** It causes acidified potassium manganate(VII) to turn from colourless to purple.

**40** In the electrolysis of an aqueous solution of vanadium chloride, 76.5 g of vanadium, V ( $A_r = 51$ ), is deposited at the cathode by 4.5 moles of electrons. What is the charge on the vanadium ion?

**A** 1+                                      **B** 2+                                      **C** 3+                                      **D** 6+

### Section A

Answer **all** questions.

- 1** Fig. 1.1 shows the electron arrangement of six elements from Period 3 of the Periodic Table. The elements are represented by the letters, **A**, **B**, **C**, **D**, **E** and **F**.

Each diagram shows outer electrons only.

**Fig. 1.1**

- (a)** Which elements are reducing agents?

[1]

- (b)** Which elements form oxides that react with aqueous sodium hydroxide only?

[1]

- (c)** Which element exists as a giant network of atoms that are covalently bonded?

[1]

- (d)** Draw a 'dot-and-cross' diagram to show the bonding of the compound formed between element **B** and **D**.

[2]

[Total: 5]

- 2 Sulfuric acid, widely used in the production of detergents and fertilisers, is manufactured on an industrial scale via the Contact Process. The process involves the following key reactions as shown in Table 2.1.

Table 2.1

| stage | reaction                                                                                                              | conditions                                                                                    |
|-------|-----------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| 1     | $\text{S (s)} + \text{O}_2 \text{ (g)} \rightarrow \text{SO}_2 \text{ (g)}$                                           | $\Delta H = - 297 \text{ kJ/mol}$                                                             |
| 2     | $2\text{SO}_2 \text{ (g)} + \text{O}_2 \text{ (g)} \rightleftharpoons 2\text{SO}_3 \text{ (g)}$                       | 450 °C<br>1- 2 atm<br>$\text{V}_2\text{O}_5$ as catalyst<br>$\Delta H = - 196 \text{ kJ/mol}$ |
| 3     | $\text{SO}_3 \text{ (g)} + \text{H}_2\text{SO}_4 \text{ (l)} \rightarrow \text{H}_2\text{S}_2\text{O}_7 \text{ (l)}$  | Heat produced varies.                                                                         |
| 4     | $\text{H}_2\text{S}_2\text{O}_7 \text{ (l)} + \text{H}_2\text{O (l)} \rightarrow 2\text{H}_2\text{SO}_4 \text{ (aq)}$ | Heat produced varies.                                                                         |

- (a) A student made the following comment.

‘In stage 2, the catalyst reduces the activation energy for the reaction and therefore the enthalpy change of the reaction is lower.’

Do you agree with this statement. Explain why.

.....

.....

.....

.....

[2]

- (b) Explain, in terms of oxidation state, which stage(s) involve(s) redox reactions.

.....

.....

.....

.....

.....

[3]

- (c) The percentage yield to produce sulfuric acid from sulfur is only 96 – 98%. Using the information in Table 2.1, explain why.

.....

.....

[1]

- (d) (i) Draw an energy profile diagram for the backward reaction in stage 2 of the contact process.

Label clearly the

- reactants and products,
- enthalpy change and
- activation energy of the reaction.

- (ii) Calculate the total amount of heat produced from stage 2 when 50 kg of  $\text{SO}_3$  is produced.

[2]

[Total: 10]

- 3 (a) A student investigated the electrolysis of concentrated aqueous potassium chloride using the set-up as shown in Fig. 3.1.

Fig. 3.1

- (i) Construct the half-equation, with state symbols, for the reaction at electrode P.

[1]

- (ii) Describe and explain what you will observe in the beaker containing aqueous sodium bromide as the electrolysis experiment proceeds.

[3]

- (iii) The student conducted a second experiment. Dilute copper (II) chloride was used instead of concentrated potassium chloride. Predict and explain the expected observations in the gas syringe and beaker containing aqueous sodium bromide.

[3]

- (b) Fig. 3.2 shows a set-up to electroplate an object with silver.

**Fig. 3.2**

- (i) On Fig. 3.2, indicate the direction of electron flow. [1]

- (ii) A student would like to coat his metal toy car with silver. In which electrode, 1, 2, 3 or 4, should he place his toy car?  
 With the help of a half-equation, explain your answer.

.....  
 .....  
 ..... [2]

- (iii) Describe and explain how the pH of the electrolyte in cell 2 changes during the experiment.

.....  
 .....  
 .....  
 ..... [2]

[Total: 12]

- 4 Fig. 4.1 shows the setup with two tubes, 1 and 2, to investigate the rate of diffusion of gases. Two pieces of cotton wool soaked in fluorine and chlorine solution were placed in one end of tubes 1 and 2 respectively. The solution on the filter papers of both tubes turned brown.

**Fig. 4.1**

Table 4.1 shows the time taken for the gases to diffuse and for the solution on the filter paper to turn brown.

**Table 4.1**

| gas              | $M_r$ | time taken / s |
|------------------|-------|----------------|
| fluorine, $F_2$  |       | 16             |
| chlorine, $Cl_2$ |       | 29             |

- (a) Complete Table 4.1 by filling in the  $M_r$  for each gas. [1]

- (b) Construct an ionic equation for the reaction in tube 1.

[1]

- (c) A student makes this conclusion:

'The rate of diffusion is directly proportional to the relative molecular mass of each gas.'

Do the measurements obtained in the experiment support this conclusion?

Explain your reasoning.

[2]

[Total: 4]

- 5 (a) Table 5.1 gives the structures of four organic substances, **A**, **B**, **C** and **D**.

Table 5.1

| <b>A</b>                                                                          | <b>B</b>                                                                            |
|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
|  |   |
| <b>C</b>                                                                          | <b>D</b>                                                                            |
|  |  |

- (i) Substance **B** can be synthesised from substance **A** in two consecutive reaction steps.  
Write the chemical equation for each step involved, showing displayed formulae of all organic substances.

step 1:

step 2:

[3]

- (ii) State the names of the two organic substances that react to form **C**.

[1]

- (iii) The labels of the four solutions, **A**, **B**, **C** and **D** have been misplaced. A chemist must conduct chemical tests to distinguish and identify each solution. Describe chemical tests the chemist could conduct to identify each of the four solutions in a sequential manner.

[3]

- (b) Used cooking oil being processed to produce biodiesel has gained a significant amount of consideration within the world of fuel production. During the conversion process, fatty acid triglycerides in vegetable oil react with methanol, in presence of an alkali catalyst, to produce biodiesel. Biodiesels are fatty acid methyl esters (FAME), which has similar properties to petrol diesel. The by-product of this reaction is glycerol, a tri-ol, which is extracted and used for other products including soaps and cosmetics.

The structure of triglycerides and FAME are

where R is a hydrocarbon chain.

- (i) One mole of fatty acid triglyceride reacts with 3 moles of methanol to produce FAME and glycerol.

Construct a chemical equation for this reaction. Show the structural formulae of the organic molecules.

[2]

- (ii) Suggest why glycerol is known as a tri-ol.

[1]

- (iii) Methanol is used due to its accessibility and low cost. However, other alcohols such as ethanol and propanol can also be used in the conversion process.

Draw the structure of FAME if propanol is used in place of methanol.

[1]

[Total: 11]

- 6 Ethylamine,  $\text{CH}_3\text{CH}_2\text{NH}_2$ , behaves similarly to ammonia in terms of its chemical properties. The equation below shows what happens when ethylamine is dissolved in water.

- (a) According to the Bronsted-Lowry theory, an acid is defined as a species that can donate protons ( $\text{H}^+$ ), while a base is a species that can accept protons. Based on the Bronsted-Lowry theory and the given equation, explain why ethylamine acts as a base.

[1]

- (b) A pH probe attached to a computer measures pH changes during titration experiments. In experiment 1,  $0.25 \text{ mol/dm}^3$  sulfuric acid was added from a burette to  $25.0 \text{ cm}^3$  of dilute sodium hydroxide in a conical flask. This is shown in Fig. 6.1.

Fig. 6.1

- (i) Using the information in Figure 6.1, calculate the concentration of sodium hydroxide used in experiment 1.

[2]

- (ii) A second experiment was carried out. This time,  $0.25 \text{ mol/dm}^3$  hydrochloric acid was added from the burette to  $25.0 \text{ cm}^3$  of ethylamine solution of the same concentration as sodium hydroxide in experiment 1 (calculated in (b)(i)) in a conical flask. On Fig. 6.1, sketch the graph you would expect from this experiment. Label as experiment 2. Explain your answer.

[3]

[Total: 6]

- 7 A student conducted an experiment using 2.00 g of impure lead (II) carbonate and excess nitric acid of concentration  $0.150 \text{ mol/dm}^3$  in a conical flask.

She measured the mass of the setup at fixed time intervals and obtained the following graph, experiment 1, as shown in Fig. 7.1.

**Fig. 7.1**

- (a) Calculate the percentage purity of the lead (II) carbonate sample.

[2]

- (b) The student conducted a second experiment using sulfuric acid of the same concentration and volume. All other variables are kept constant.

- (i) On the same axes in Fig. 7.1, draw the graph that he would obtain for the experiment using sulfuric acid. Label it as experiment 2.

[1]

- (ii) Explain the difference between the graphs drawn for experiment 1 and 2.

.....

.....

.....

.....

.....

.....

.....

[2]

- (c) The student conducted a third experiment using ethanoic acid of the same concentration and volume. All other variables are kept constant. Lead (II) ethanoate is soluble in water.

- (i) On the same axes in Fig. 7.1, draw the graph that he would obtain for the experiment using ethanoic acid. Label it as experiment 3.

[1]

- (ii) Explain your reasoning for the graph obtained for (c)(i).

.....

.....

.....

.....

.....

[2]

- (d) Describe how you would prepare a dry sample of lead (II) carbonate in the laboratory.

## 8 Non-BPA bottles

Due to health concerns, many manufacturers now produce Bisphenol A (BPA) — BPA-free bottles, especially for items used by infants and for food storage. There are three main types of BPA-free bottles: PET (Polyethylene terephthalate), HDPE (High-density polyethylene) and co-polyester.

Table 8.1 gives some information on the three types of bottles.

**Table 8.1**

|              | PET                                                                                                                                                                                                                                                                | HDPE     | co-polyester                                                                                                                                                              |

In the context of polymer chemistry and packaging, sustainability refers to how well a material minimises environmental impact over its entire life cycle, from production to disposal.

When evaluating the sustainability of plastic bottles, three key indicators are commonly used, *atom economy*, *carbon footprint* and *recyclability*.

Atom economy is defined as the proportion of reactant atoms that are incorporated into the final product, rather than ending up as waste or by-products.

$$\text{atom economy} = \frac{\text{mass of desired product}}{\text{mass of all reactants}} \times 100\%$$

Carbon Footprint is defined as the total mass of  $CO_2$  emitted during the production of 1 kg of material.

Recyclability is the ease with which a material can be collected, processed, and reused at the end of its life.

Table 8.2 gives more information on each bottle type.

**Table 8.2**

| <b>bottle type</b>             | <b>material</b> | <b>average mass<br/>per bottle (g)</b> | <b>carbon<br/>footprint of<br/>material<br/>(kg CO<sub>2</sub> / kg)</b> | <b>can be<br/>recycled</b> | <b>reuse</b> |
